

ABSTRACT

The invention provides a positioning structure for a door fastener, which is to encircle a positioning area on a metal case so as to provide a firm positioning to a door fastener with lodge-in space. The invention
5 includes a vertical panel that meets the thickness of the lodge-in space, a through hole provided on the vertical panel, and an upper curb portion provided at the through hole on the vertical panel. Besides, two side curb portions are provided on the horizontal panel corresponding to the width of the door fastener; in all, the upper curb portion, two side curb
10 portions, and the horizontal panel encircle a positioning area that can form a firm positioning for the door fastener when the door fastener is placed into the positioning area through the through hole.
